

3D Character Animation Intermediate

Configure Avatar:

Define one main character model, and use it to create an Avatar so that all the bones in the rig are mapped.

This makes it easier to import external humanoid animations and map them to this main character, using “Copy From Other Avatar”

3D Character Animation Advanced

For Devs:

In a FBX file with animations, in the Import Settings, you can trigger code at specific times in an AnimationClip.

Use the “**Events**” import setting, and name a “**Function**” (method). It will trigger a “SendMessage” function on this object and look for a script that has the method you named.

This works great for timing footstep sounds perfectly, for example.
